(i) $e^{\mathcal{L}}$, random GKSL
fit error $\|R_{\text{net}} - R\|_F$
depth L (residual blocks)
(ii) damping ∘ rotation
fit error $\|R_{\text{net}} - R\|_F$
depth L (residual blocks)
(iii) Pauli, det = −1/27
distance to the target
1/3
1/6
depth L (residual blocks)
(iii) determinant of the fit
$\det R_{\text{net}}$
target −1/27
depth L (residual blocks)
residual, $p = 0.2$, fit error
one Lindblad layer
one Stinespring layer
residual, worst-case trace distance
proved bounds 1/3, 1/6 (det ≥ 0)
